# Kick-Start: Bower – A Simple Tutorial of Setting-Up and Using Bower.JS

Posted on [October 26, 2013](#)

The goal of this post is to provide a simple description of how to install Bower JS and how to use Bower JS to manage client side dependencies. The first time I tried to use Bower I had problems. Hopefully this tutorial will provide others a complete resource to navigate around the issues that I found.

### Assumptions:

- You are a Windows developer
- You will use the Windows Command Prompt instead of Bash
- You have little or no knowledge of Node.js
- You have little or no knowledge of GIT

## 1. Download and install Node.js

To run Bower you will need to download and install Node.js. Go to <http://nodejs.org/> website and select the “install” button (see image below). This should download the version of Node.js you need. For me, when I clicked the “install” the version for Windows 64-bit downloaded. Once Node.js is download, execute the file.

I will **not** go through the steps for installing Node.js; it's very straightforward. During the install I used all default options.

## 2. Confirm Node.js is installed

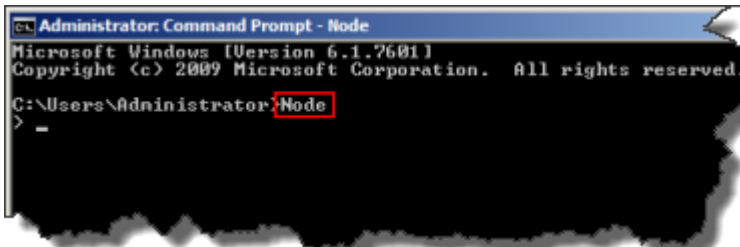

When Node.js installation has completed we need to confirm it. Open Windows Command Prompt and type “Node” and [enter]. You should see the Node.js version.

(If you previously had Windows Command Prompt open, you need to close it and reopen it. The reason is that when you install Node, it will

successfully. Open a Windows Command Prompt and type “Node” and [enter].

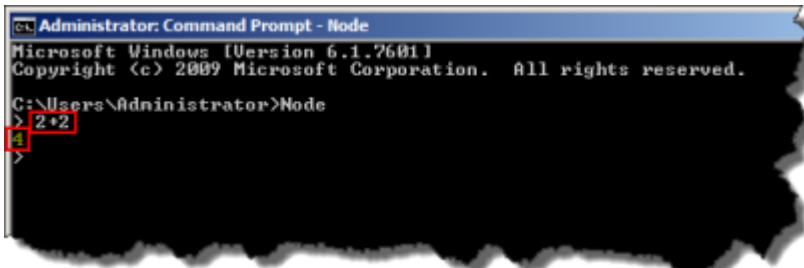

and reopen it. The reason is that when you install Node, it will

not have the new Node Path.)

```
C:\Users\Administrator>Node
```

Now at the prompt type something like “2 + 2” and [enter]. You should get a result. I got back 4. Now we have confirmed that Node.js is installed correctly. You can quit Node.js by using the keyboard and typing [ctrl]+C twice.

```
C:\Users\Administrator>Node
> 2+2
4
```

### 3. Create Folder Structure

Create the following folder structure.

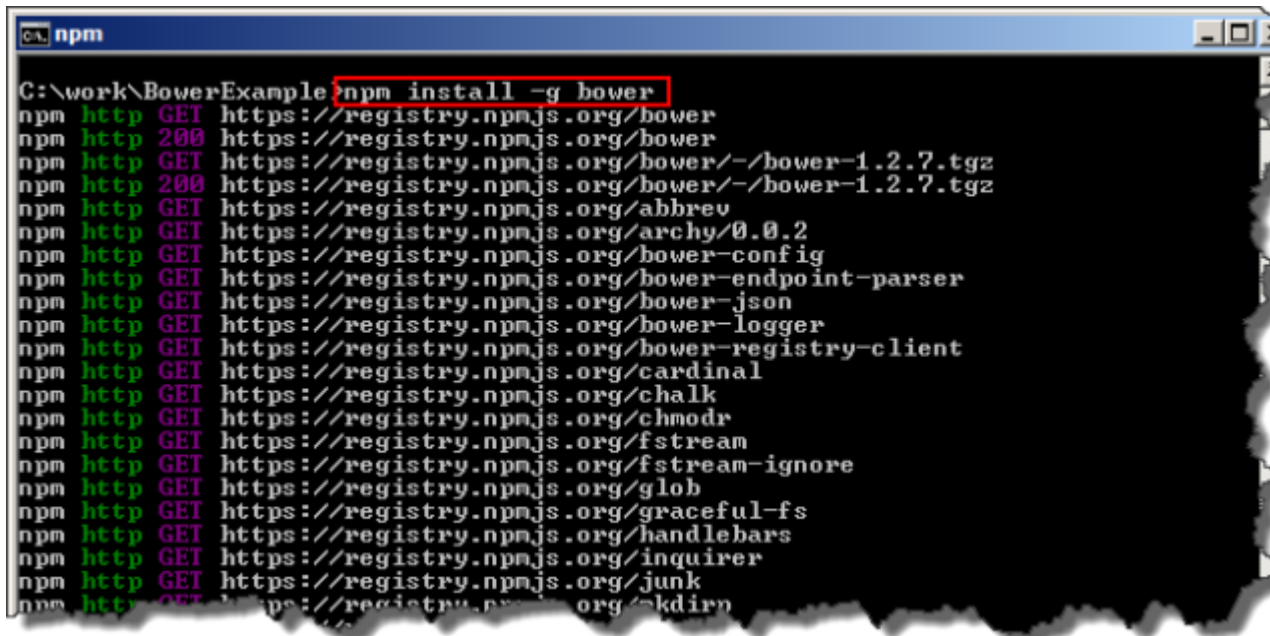

(In the image above, ignore “External Libraries”. This is part of the WebStorm IDE)

## 4. Install Bower

The primary reason to use Bower is so that you do not have to manage client side dependencies (css, JavaScript, and etc). Here we will install Bower so that we can use it latter to manage dependencies.

Use Node Package Manger (npm) to install Bower. Since we are using the “-g” (global) switch we can install Bower from any directory.

```
C:\work\BowerExample>npm install -g bower
npm http GET https://registry.npmjs.org/bower
npm http 200 https://registry.npmjs.org/bower
npm http GET https://registry.npmjs.org/bower/-/bower-1.2.7.tgz
npm http 200 https://registry.npmjs.org/bower/-/bower-1.2.7.tgz
npm http GET https://registry.npmjs.org/abbrev
npm http GET https://registry.npmjs.org/archy/0.0.2
npm http GET https://registry.npmjs.org/bower-config
npm http GET https://registry.npmjs.org/bower-endpoint-parser
npm http GET https://registry.npmjs.org/bower-json
npm http GET https://registry.npmjs.org/bower-logger
npm http GET https://registry.npmjs.org/bower-registry-client
npm http GET https://registry.npmjs.org/cardinal
npm http GET https://registry.npmjs.org/chalk
npm http GET https://registry.npmjs.org/chmodr
npm http GET https://registry.npmjs.org/fstream
npm http GET https://registry.npmjs.org/fstream-ignore
npm http GET https://registry.npmjs.org/glob
npm http GET https://registry.npmjs.org/graceful-fs
npm http GET https://registry.npmjs.org/handlebars
npm http GET https://registry.npmjs.org/inquirer
npm http GET https://registry.npmjs.org/junk
npm http GET https://registry.npmjs.org/mkdirp
```

(The npm statement is case sensitive.)

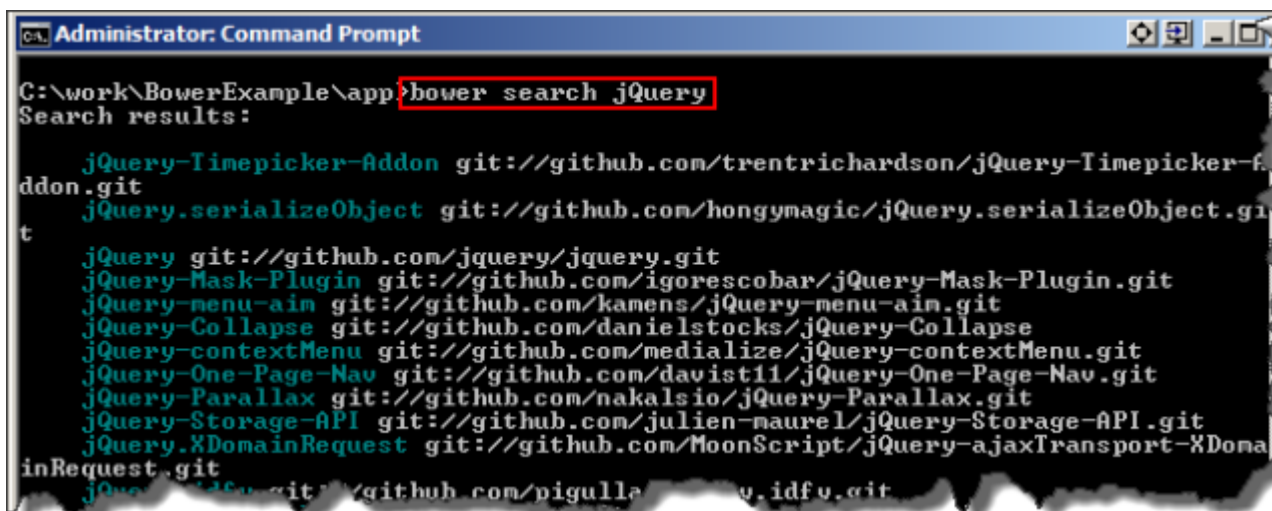

## 5. Test Bower is Installed

Since we will want to install the dependencies in the “app” direction, go ahead and navigate to the “app” directory”

```
Administrator: Command Prompt
C:\work\BowerExample>cd app
C:\work\BowerExample\app>
```

Lets do a Bower search for jQuery. Remember, it is case sensitive

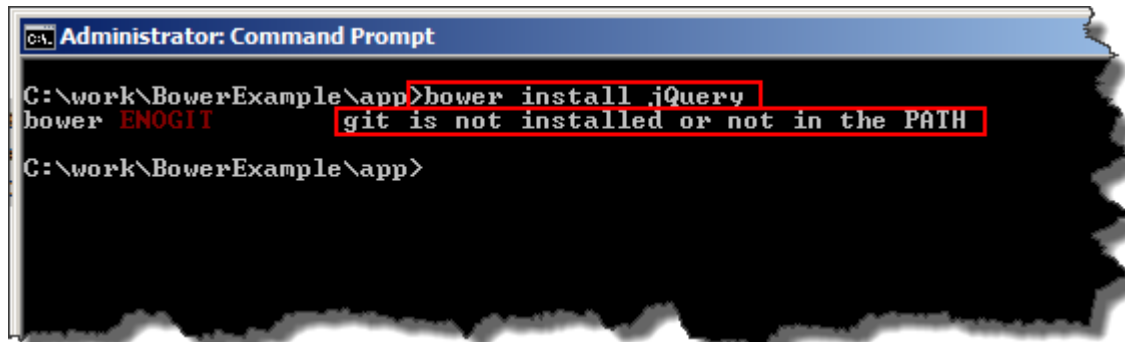

```
Administrator: Command Prompt
C:\work\BowerExample\app>bower search jQuery
Search results:
jQuery-Timepicker-Addon git://github.com/trentrichardson/jquery-timepicker-f
ddon.git
jQuery.serializeObject git://github.com/hongymagic/jquery.serializeObject.gi
t
jQuery git://github.com/jquery/jquery.git
jQuery-Mask-Plugin git://github.com/igorescobar/jquery-mask-plugin.git
jQuery-menu-ain git://github.com/kamens/jquery-menu-ain.git
jQuery-Collapse git://github.com/danielstocks/jquery-collapse
jQuery-contextMenu git://github.com/medialize/jquery-contextmenu.git
jQuery-One-Page-Nav git://github.com/davist11/jquery-one-page-nav.git
jQuery-Parallax git://github.com/nakalsio/jquery-parallax.git
jQuery-Storage-API git://github.com/julien-naurel/jquery-storage-api.git
jQuery.XDomainRequest git://github.com/MoonScript/jquery-ajaxTransport-XDona
inRequest.git
jQuery.git git://github.com/pigulla/jquery.git
```

There is a ton of jQuery libraries. But that’s okay.

## 6. Install Dependencies (jQuery & Underscore)

In the command window enter “bower install jQuery” and press [Enter]. Again remember case sensitivity.

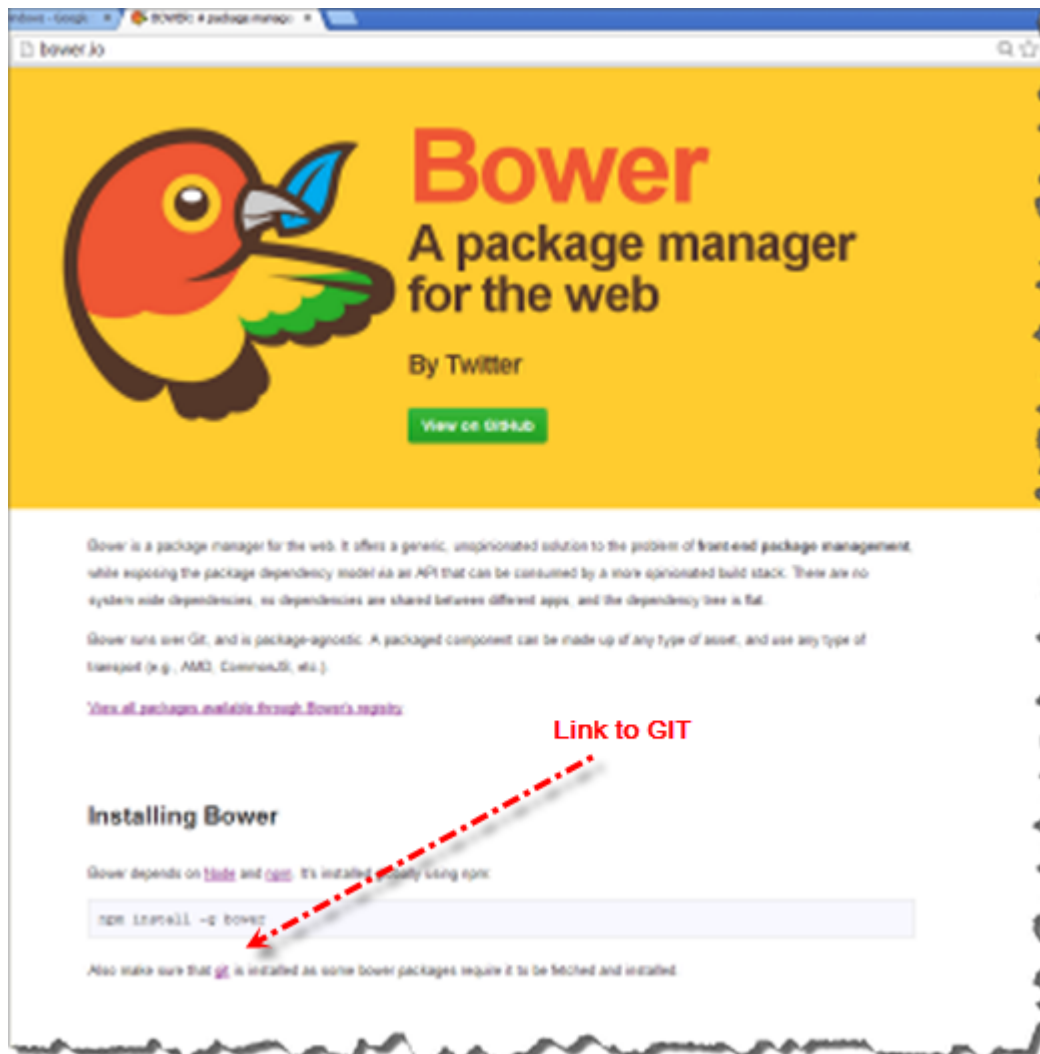

A screenshot of a Windows Command Prompt window titled "Administrator: Command Prompt". The prompt shows the directory "C:\work\BowerExample\app" and the command "bower install jQuery" being entered. Below the command, the output "bower ENOGIT" is displayed in red, followed by the error message "git is not installed or not in the PATH" in white text. The prompt then returns to "C:\work\BowerExample\app>".

```
Administrator: Command Prompt
C:\work\BowerExample\app>bower install jQuery
bower ENOGIT git is not installed or not in the PATH
C:\work\BowerExample\app>
```

You may receive an error if you do not have GIT installed.

## Install GIT

From Bower's website ([bower.io](http://bower.io)) you can get to GIT's ([git-scm.com](http://git-scm.com)) website to down GIT.

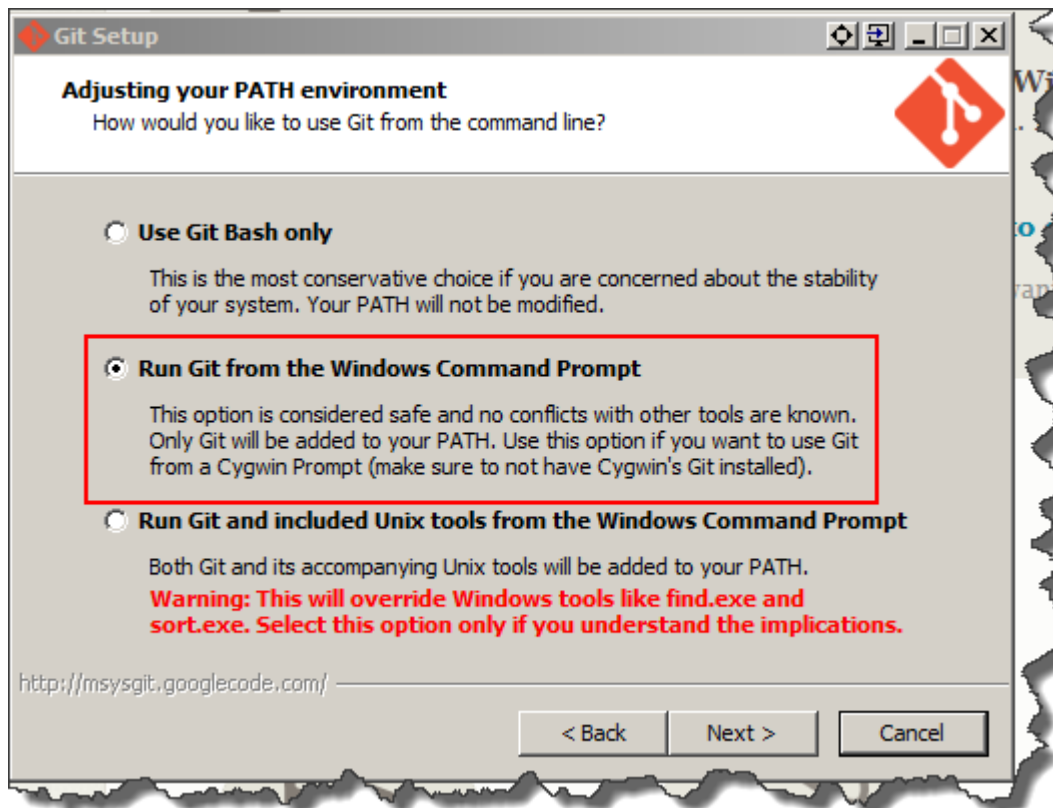

From GIT's ([git-scm.com](http://git-scm.com)) download GIT

When I installed GIT, I used all the defaults. But a key option that needs to be select is to “Run Git from the Windows Command Prompt”. This will add the PATH variable for Git.

## 8. Install Dependencies (jQuery & Underscore) – Again

**Important** – Close the current Command Prompt. If you attempt to install jQuery again with the current command prompt you will get the same error.

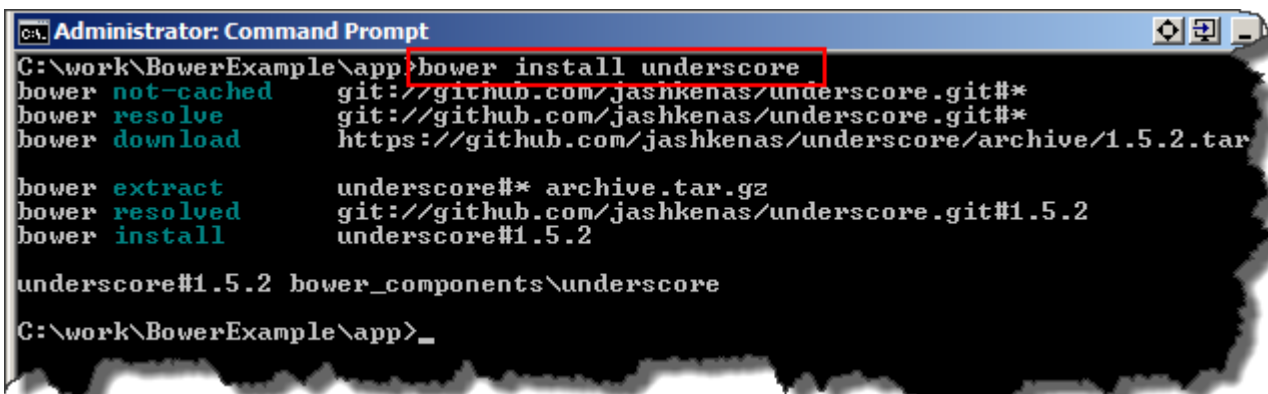

Open a new Command Prompt and navigate to the “app” directory that we created previously.

Install jQuery using Bower. Remember, it's case sensitive.

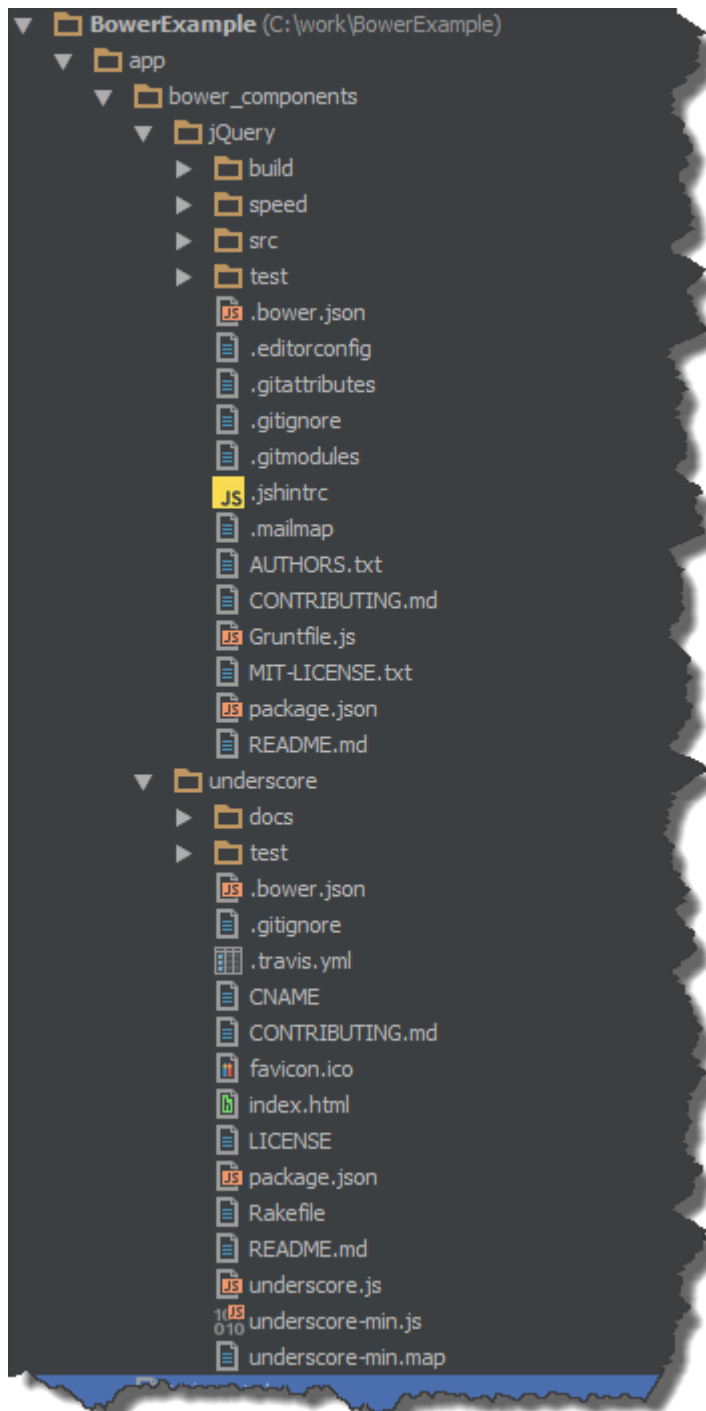

Now install Underscore

## 9. Confirm Dependencies

There should be a new directory create by Bower call “bower\_components” this is where jQuery and Underscore should have been installed at.

## 10. Finished

No you can go out and create your application without having to worry maintaining client side dependencies.

I hope this helped.

Really helpful but what is benefit of using Bower while we can just link jquery and underscore from CDN directly.

And also why in your last pic jquery and underscore folder has many other folders and files?

Thanks very much. In step 3 the WebStorm bit comes out of the blue – you just lost everyone who does not use it, but fortunately I do. Thanks for taking the time to create this easy-to follow post.

I was trying to install Zurb Foundation 5 SASS version and being a newbie to Ruby and Git followed their instructions and installed both before running the Bower-based install. Their documentation mentioned nothing about the install options required so I went with the defaults (not the smartest, I know but it was a means to an end).

Your point about ensuring the checkbox to Run Git from Windows Command Prompt was a lifesaver and put me onto the right path.

Thanks for your helpful and insightful post.

Hi,

thanks for a great tutorial to install Bower on Windows. It was hard to find a good tutorial for Windows user, this was the best one and very well explained.

Thanks again!

I had a problem here with the Environmental PATH not updating on installing both Node.js and GIT. It can be solved by doing 1 of 2 things. 1. Quit and restart Windows Explorer from the Windows Task manager (end process, then new task -> 'explorer') or simply restarting your computer. A closing of the command prompt is not enough. Seem many other had the same issue.

You may want to add that open cmd.exe as “Run as Administrator”, so that the steps succeed. I had to redo as Administrator as the non-admin console didn't succeed.

Thank you! This tutorial has saved my time. In my first time installing bower, I got an error because I didn't set up git correctly. After reading this tutorial, I know the problem was my git setup and fixed it.

Nice – great tutorial. I would suggest you add a hint in the Node.js install section that if Node won't run from Windows command prompt, you may need to reboot Windows and try again, because the path environment variable may not get updated until after restarting.
